

A fresh nonlinear correction repairs the contact prediction

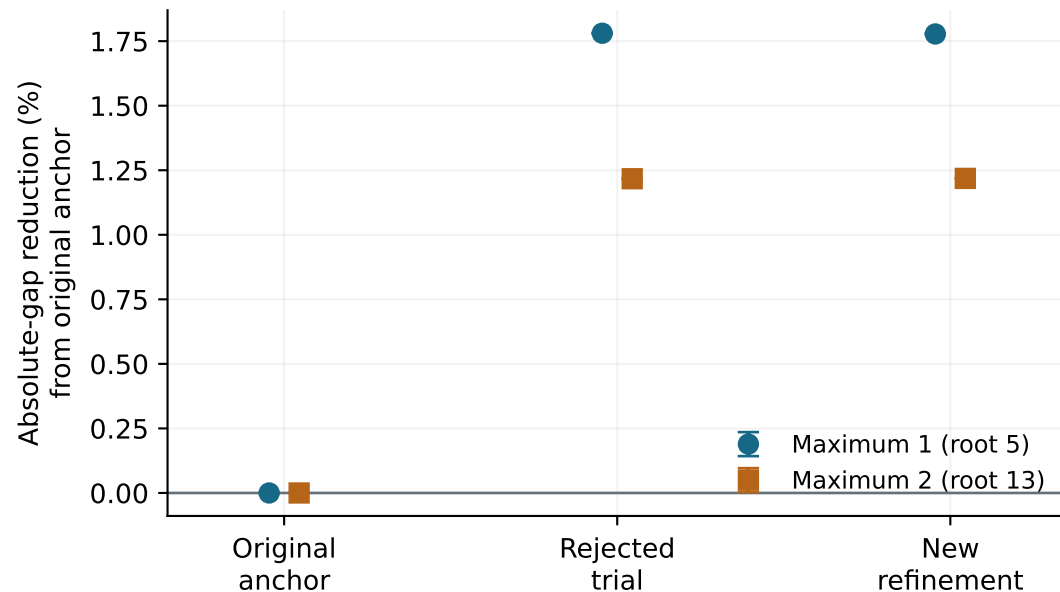

Refinement passes: contact improves at least 115.3x in every variant.

New fold/gap prediction errors: 0.0097 / 0.0162 (limit 0.1). EXP-521 remains rejected.

A All 16 contact variants

B Net progress, not trial-to-refinement gain

All variants retained: 16 full-state comparisons; four solver/window contexts for each maximum. Ranges are not confidence intervals.

The trial and refinement share $c = 7.147$; only a changes during refinement. Both gap heights remain negative.

These are discrete stages, not a continuously qualified path. No grazing endpoint, exact contact, homoclinic orbit or Jones arrow is established.
