

Following the contact direction

Continuation stopped at a rejected step; simultaneous contact is not established

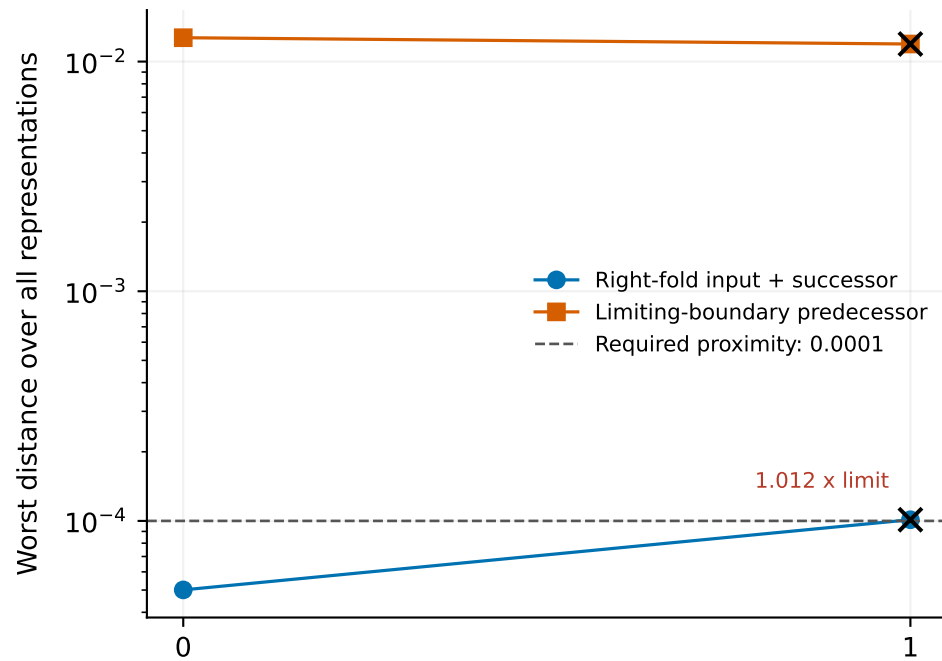

Measured path in parameter space

c (continuation moves toward lower values)

★ Starting point ✕ Rejected step (retained)

Do both full-state gaps close?

Step number (0 is the EXP-503 starting point)

All measured points are shown. Connecting lines indicate step order, not computed intervening trajectories.

Distances use the frozen state scaling and indices; they are numerical proximity tests, not exact-flow proofs.

Warm numerical seeds; correlated representations are not independent replications.
