

The nominated cycles miss the measured fold

EXP-495 | Two primitive six-return cycles at $b = 0.2$, $c = 7.212$

All 26 fold candidates retained; 10 eligible, 16 parent-ineligible. No C/D labels assigned.

● Periodic pair / full-state distance ◇ Projected fold pair ■ x-only distance baseline

Distance panels use the worst case across both solvers, both repeat windows and all eligible right-fold representatives.

Both input and its correct next return must match at the same cycle index. Primary radius = 0.0001; scales = (15, 15, 0.01).

Sixteen failed parent searches are not zero-distance observations. All four depth/direction families contribute in each case.

Operational finite-resolution proximity, not exact critical membership, a complete partition, or a test of Jones's insertion arrows.
